

# Screen Printers Say: "This Changes Everything."

## NEW UVISPEED HALFTONE INKS INCREASE PRESS SPEEDS UP TO 25%.

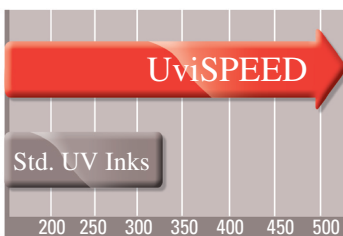

Today's graphics' customers demand quicker job turnarounds at lower cost, without compromising print quality. "Increasing productivity and efficiency" are no longer just fancy buzzwords. They are absolute requirements to achieve desired profit margins, manage challenging deadlines and guarantee that next customer order.

Our new UviSPEED range of halftone inks are uniquely formulated to increase in-line press speeds by up to 25%, resulting in faster turnaround of even the highest-quality screen jobs.

A key component of UviSPEED ink is a rheology that produces the right body for a nice flood and shear. Achieving optimal dot height and cure means

no blocking at the highest press speeds and virtually no dot gain even on the longest print runs.

Set up time is quicker, too. The ink flows out rapidly on the screen. Proof to press is now measured in minutes instead of hours.

Impressions Per Hour

Fujifilm Sericol has once again redefined ink value in four-color process printing... with productivity increases throughout every stage of the screen print process to dramatically reduce your cost per print.

In a market that demands superior print quality at high speeds and an affordable price – UviSPEED delivers. To learn how UviSPEED has impacted the competitive position of screen printers...
